

Progressive scan CCD color camera KP-FR39PCL/SCL Specifications (Preliminary)

1. General

The KP-FR39PCL/SCL are CameraLink output system progressive scan RAW data output color CCD camera with a 1/3-inch size CCD which adopted the RGB primary color filter and a full frame shutter.

The image of 659 (H) x 494 (V) is output in RAW data at 91 frames per second.

The square format picture elements provide suitability for image processing applications.

2. Outstanding features

(1) High speed and high color fidelity

The 1/3-inch 330,000 pixels square lattice progressive scan CCD and the RGB primary color mosaic filter achieve a high color fidelity of 659 (H) x 494 (V) (VGA) and high speed at 91 frames per second.

(2) Small-sized camera

The camera has small SDR connector for digital outputs.

Therefore, the camera has the realization of small-sized shape of 29 (W) x 29 (H) x 29 (D) mm.

(3) Remote control

- Multi-step electronic shutter (from 1/91 to 1/50000 second in 8 steps)

- Variable shutter (minimum 1/100000 second)

- Frame on demand (the image capture at desired timing using the external trigger signal) and other various functions are set by remote control via CameraLink cable.

(4) Power over CameraLink

Power supply of KP-FR39PCL is input via CameraLink cable.

(Note: Power supply of KP-FR39SCL is input from DCIN connector.)

$$1H = 46.875\text{KHz} = 21.33\mu\text{s}$$

When partial scan is ON, *1 to *4 are variable by start position of picture grabbing and width of picture grabbing (omit the figures after the decimal fractions).

$$*1: (17 + \text{Width} + (496 - \text{Width}) / 7)H$$

$$*2: (3 + (496 - \text{Width}) / 7 - \text{Start} / 7)H$$

$$*4: (\text{Width})H$$

Note1: Please use the partial scan in following condition.

$$\text{Start} + \text{Width} = 495$$

Note2: Please use FVAL in the partial scan.

Graph following shows frame rate in each width of picture grabbing when partial scan is ON.

Note: Frame rate can be calculated from following equations using width of picture grabbing.

$$\text{Lines} = 17 + \text{Width} + (496 - \text{Width}) / 7$$

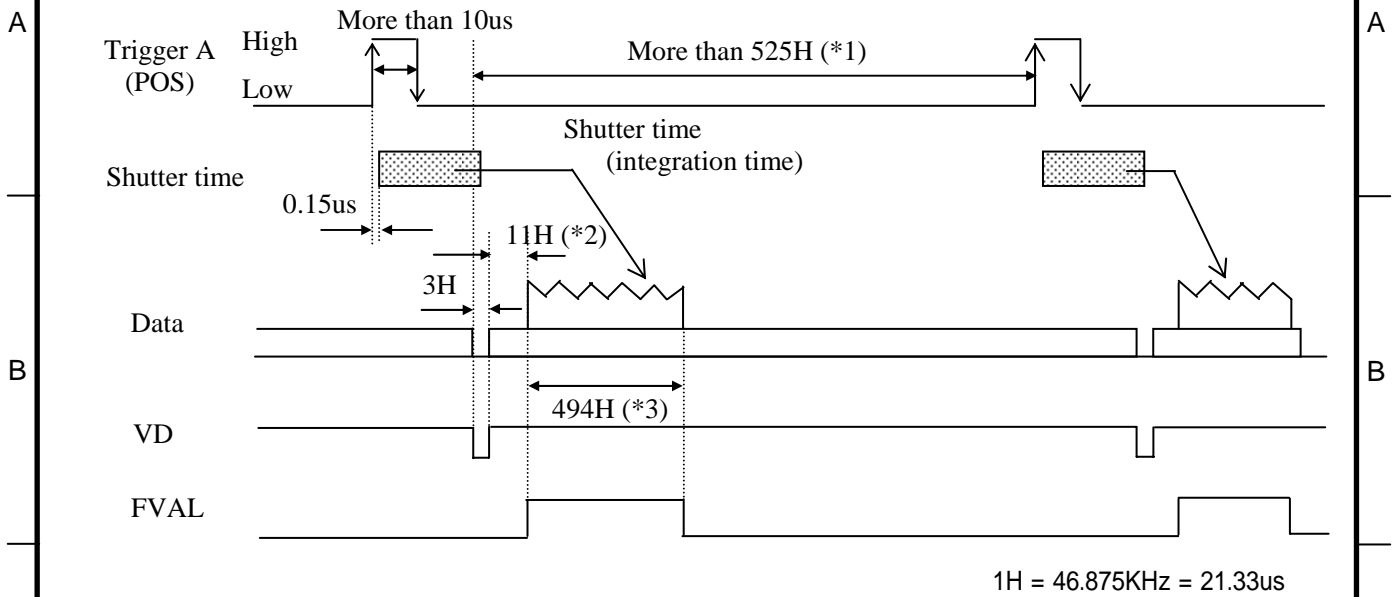

$$\text{Frame rate} = (36000000 / 768) / \text{Lines}$$

- *1: $(17 + \text{Width} + (496 - \text{Width}) / 7)H$ or more
- *2: $(11 + \text{Start} / 7)H$
- *3: $(\text{Width})H$

Note1: Please use the partial scan in following condition.

$$\text{Start} + \text{Width} \leq 495$$

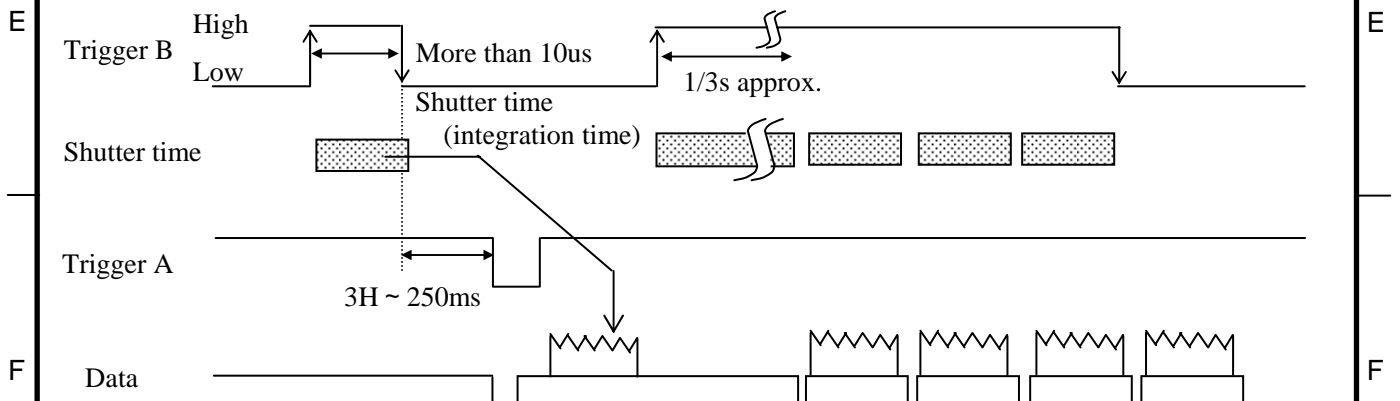

Note2: Please use FVAL in the partial scan.

Special function of reset control mode

The camera shifts to the output of a normal mode (continuous output) when Trigger B signal passes about 1/3 second in the state of High.

It returns to the Trigger mode if Trigger B signal becomes Low.

However, after becoming Low Trigger B, the period of 50 ms becomes a Trigger signal input prohibition period.
